CROSS-REFERENCE TO RELATED  
 APPLICATIONS

This application is a divisional of co-pending application Ser. No. 10/544,069 filed Jul. 29, 2005, which is the national phase filing of PCT/JP2004/000741 filed Jan. 28, 2004, the disclosures of which are expressly incorporated herein by reference.

TECHNICAL FIELD

The present invention relates to thieno[2,3-d]pyrimidine compounds exhibiting gonadotropin releasing hormone (GnRH) antagonizing activity, their production and use.

BACKGROUND ART

Secretion of anterior pituitary hormones undergoes feedback control by peripheral hormones secreted from target organs of the respective hormones and by secretion-regulating hormones from the hypothalamus, which is the upper central organ of the anterior lobe of the pituitary (hereinafter, these hormones are collectively called "hypothalamic hormones" in this specification). Presently, as hypothalamic hormones, the existence of nine kinds of hormones including, for example, thyrotropin releasing hormone (TRH), and gonadotropin releasing hormone [GnRH, sometimes called as LH-RH (luteinizing hormone releasing hormone)] has been confirmed. These hypothalamic hormones are believed to show their actions via the receptors which are considered to exist in the anterior lobe of the pituitary, and efforts to find the receptor-gene expression specific to these hormones, including cases of human, have been made. Accordingly, antagonists or agonists specifically and selectively acting on these receptors should control the action of the hypothalamic hormone and the secretion of anterior pituitary hormone. As a result, such antagonists or agonists are expected to prevent or treat anterior pituitary hormone dependent diseases.

Known compounds possessing GnRH-antagonizing activity include GnRH-derived linear peptides (U.S. Pat. No. 5,140,009 and U.S. Pat. No. 5,171,835), a cyclic hexapeptide derivative (JP-A-61-191698), a bicyclic peptide derivative (Journal of Medicinal Chemistry, Vol. 36, pp. 3265-3273 (1993)), and so forth. Non-peptide compounds possessing GnRH-antagonizing activity include compounds described in JP-A-8-295693 (WO 95/28405), JP-A-9-169768 (WO 96/24597), JP-A-9-169735 (WO 97/14682), JP-A-9-169767 (WO 97/14697), JP-A-11-315079 (WO 99/33831), JP-A-2000-219691 (WO 00/00493), JP-A-2001-278884 (WO 00/56739) and JP-A-2002-30087.

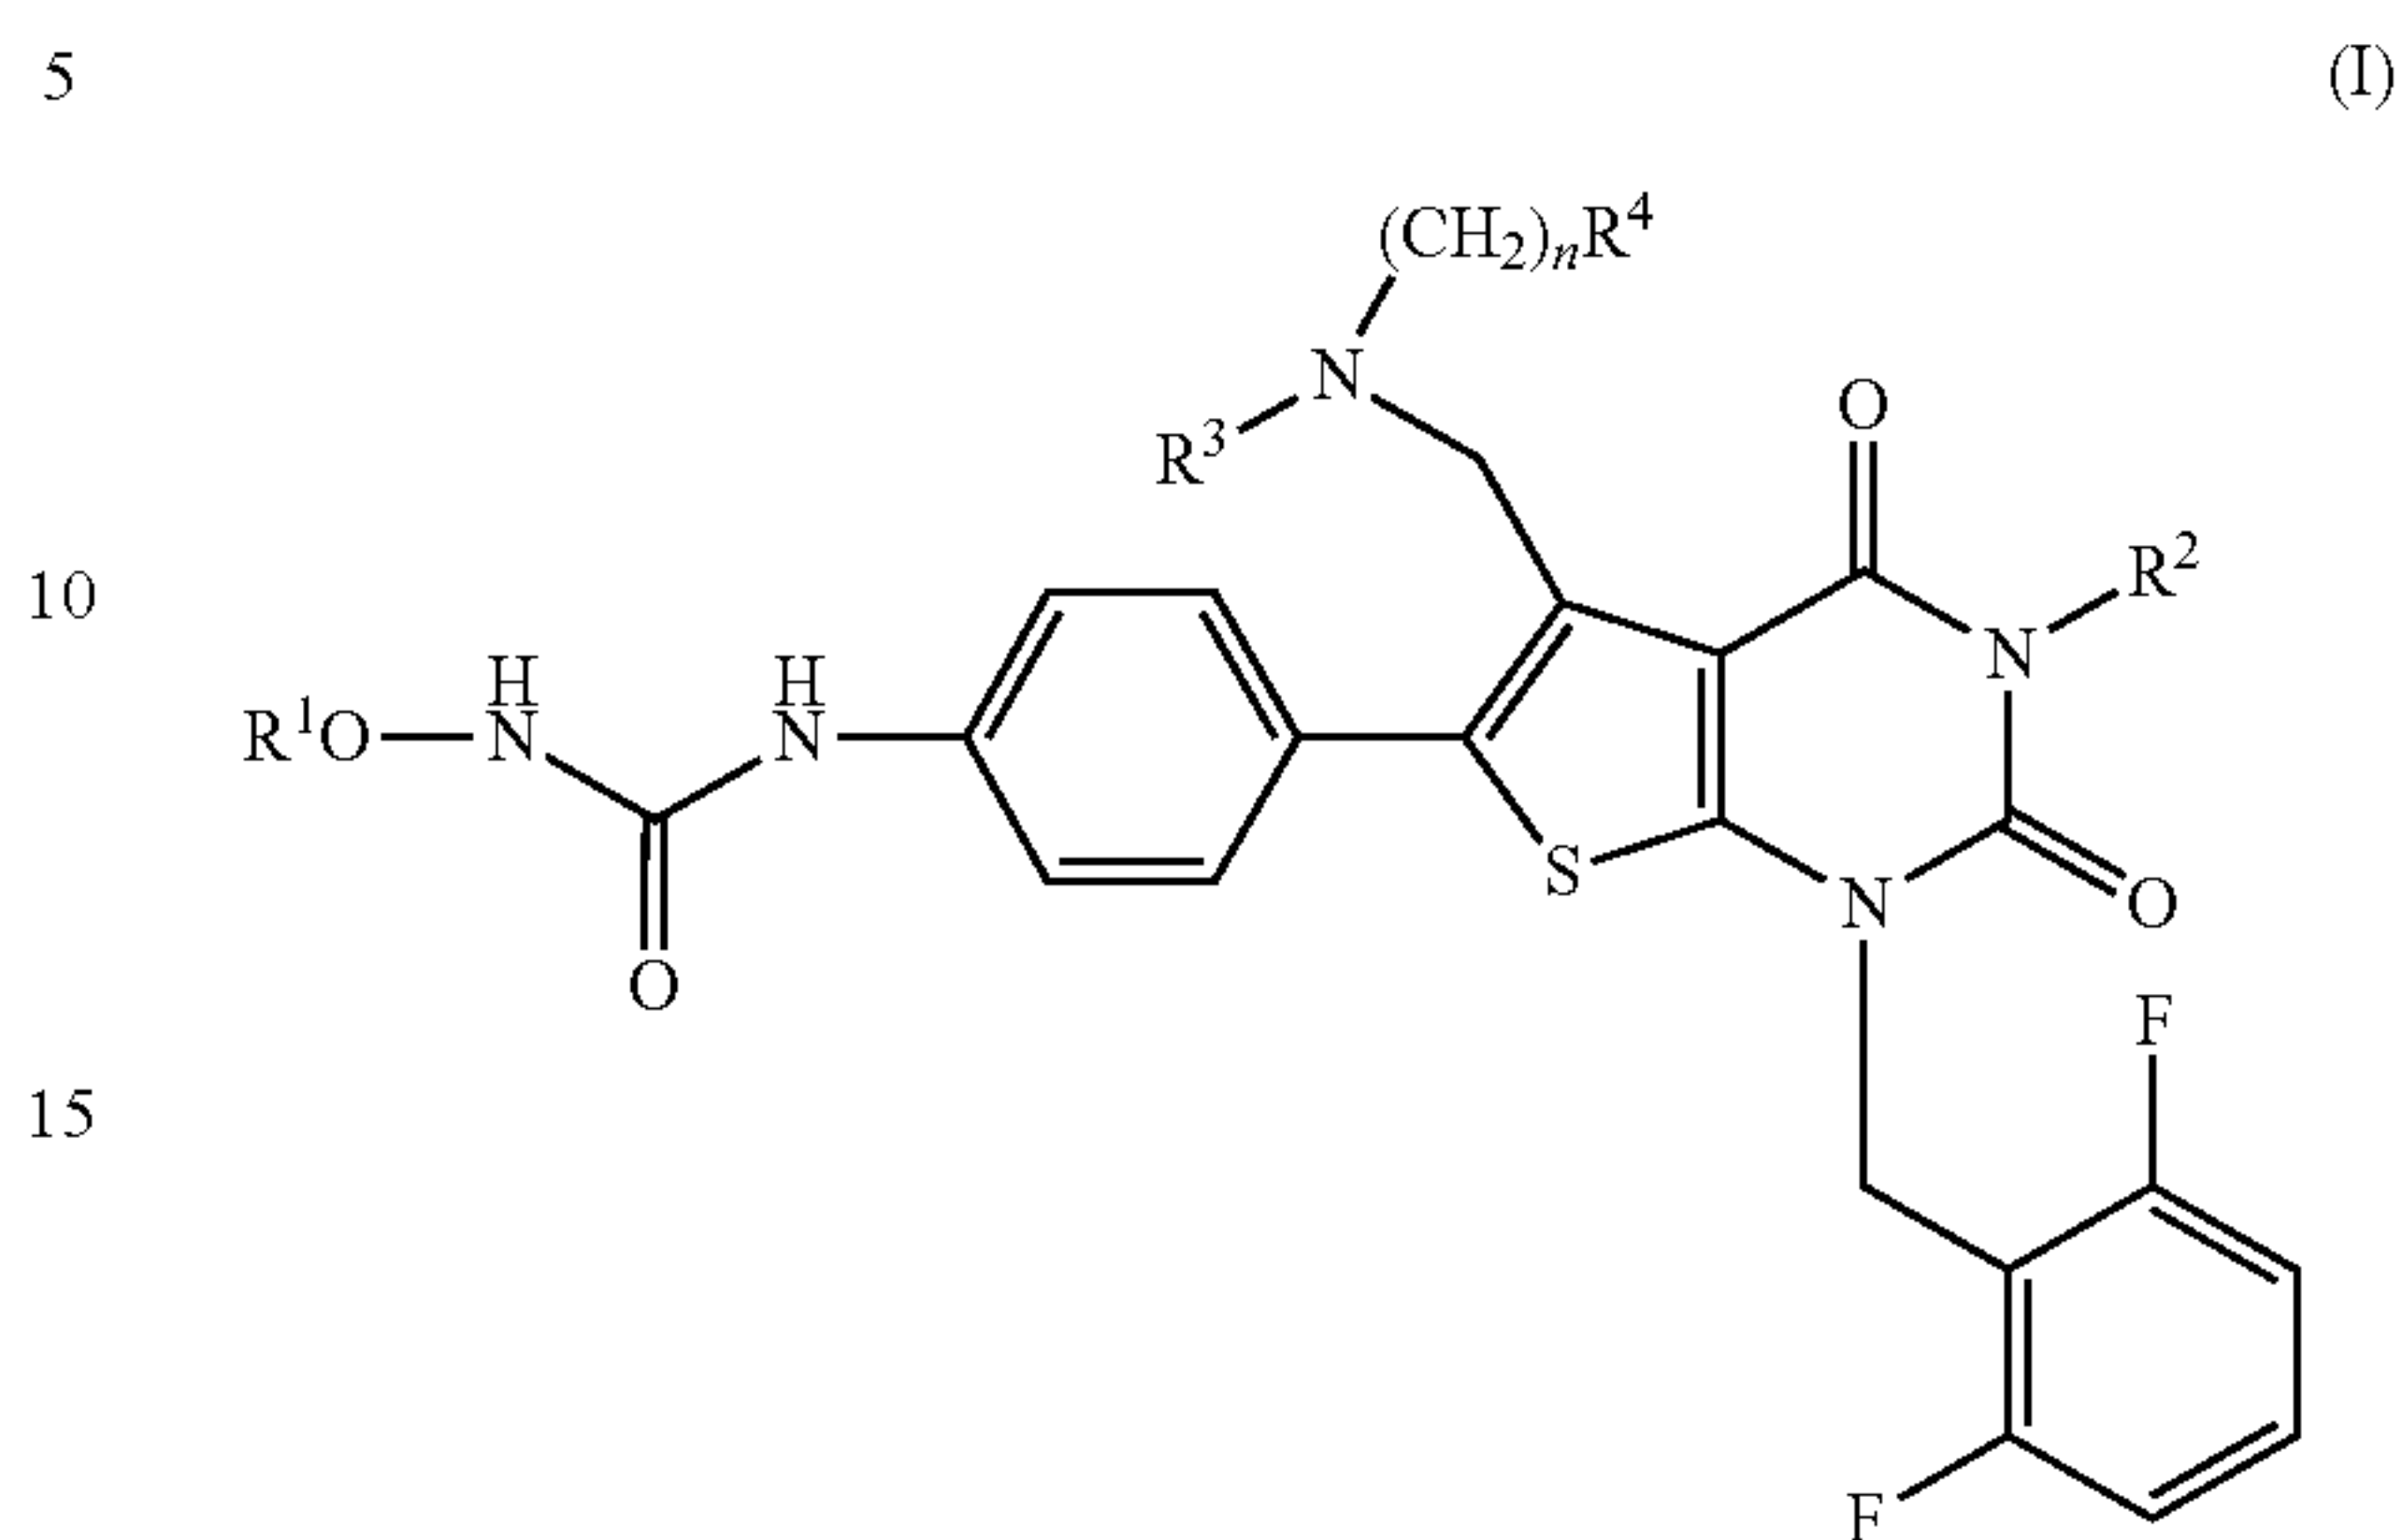

Peptide compounds pose a large number of problems to be resolved with respect to oral absorbability, dosage form, dose volume, drug stability, sustained action, metabolic stability etc. There is strong demand for an oral GnRH antagonist, especially one based on a non-peptide compound, that has excellent therapeutic effect on hormone-dependent cancers, e.g., prostatic cancer, endometriosis, precocious puberty etc., that does not show transient hypophysial-gonadotropin action (acute action) and that has excellent oral absorbability.

DISCLOSURE OF INVENTION

We, the present inventors, have conducted various investigations, and as a result, have synthesized the following novel

**2**

And we also have found that Compound (I) has an unexpected, excellent GnRH-antagonizing activity, especially strong antagonistic activity, based upon the above specific chemical structure, and extremely low toxicity and is therefore satisfactory as a medicine having GnRH-antagonizing activity, and developed the present invention based on these findings.

The reaction mixture was distributed between ethyl acetate and water. The organic layer was successively washed with water and saturated brine, dried over magnesium sulfate, and concentrated under reduced pressure. The obtained residue was roughly purified by aminopropyl silica gel column chromatography (Fuji Silysia Chemical). The obtained crude amide (350 mg) was dissolved in ethanol (25.5 ml), and a solution of 28% sodium methoxide in methanol (196 mg) was added thereto. The mixture was stirred at room temperature for 15 hours. The reaction mixture was neutralized with 1N hydrochloric acid (1 ml), and the solvent was distilled off. The residue was distributed between ethyl acetate and water. The organic layer was successively washed with water and saturated brine, and dried over anhydrous sodium sulfate. The solvent was distilled off under reduced pressure. The obtained residue was purified by aminopropyl silica gel column chromatography (45 g, eluent: ethyl acetate/hexane 7/3 to ethyl acetate) and recrystallized from THF-ethanol to give the title compound (210 mg) as colorless crystals.

(2) Preparation of CHO (Chinese Hamster Ovarian)  
Cell Membrane Fraction Containing Monkey GnRH  
Receptor

Monkey GnRH receptor-expressing CHO cells ( $10^9$  cells) were suspended in phosphate-buffered saline supplemented with 5 mM EDTA (PBS-EDTA) and centrifuged at  $100\times g$  for 5 minutes. To the cell pellet, 10 ml of a cell homogenate buffer (10 mM  $\text{NaHCO}_3$ , 5 mM EDTA, pH 7.5) was added, followed by homogenization using the Polytron homogenizer. After centrifugation at  $400\times g$  for 15 minutes, the supernatant was transferred to an ultracentrifugation tube and centrifuged at  $100,000\times g$  for 1 hour to yield a membrane fraction precipitate. This precipitate was suspended in 2 ml of an assay buffer and centrifuged at  $100,000\times g$  for 1 hour. The membrane fraction recovered as a precipitate was again suspended in 20 ml of the assay buffer, dispensed, and stored at  $-80^\circ\text{C}$ . before use upon thawing.

(3) Preparation of CHO (Chinese Hamster Ovarian)  
Cell Membrane Fraction Containing Human GnRH  
Receptor

Human GnRH receptor-expressing CHO cells ( $10^9$  cells) were suspended in phosphate-buffered saline supplemented with 5 mM EDTA (PBS-EDTA) and centrifuged at  $100\times g$  for 5 minutes. To the cell pellet, 10 ml of a cell homogenate buffer (10 mM  $\text{NaHCO}_3$ , 5 mM EDTA, pH 7.5) was added, followed by homogenization using the Polytron homogenizer. After centrifugation at  $400\times g$  for 15 minutes, the supernatant was transferred to an ultracentrifugation tube and centrifuged at  $100,000\times g$  for 1 hour to yield a membrane fraction precipitate. This precipitate was suspended in 2 ml of an assay buffer and centrifuged at  $100,000\times g$  for 1 hour. The membrane fraction recovered as a precipitate was again suspended in 20 ml of the assay buffer, dispensed, and stored at  $-80^\circ\text{C}$ . before use upon thawing.

(4) Determination of  $^{125}\text{I}$ -Leuprorelin Binding  
Inhibition Rate

The monkey and human membrane fractions prepared in the above (2) and (3) were diluted with the assay buffer to yield a 200  $\mu\text{g}/\text{ml}$  dilution, each of which was then dispensed at 188  $\mu\text{l}$  per tube. To a tube containing the cell membrane fraction of the CHO with monkey GnRH receptors expressed were added 2  $\mu\text{l}$  of a solution of 20 mM compound in 60% DMSO and 10  $\mu\text{l}$  of 38 nM  $^{125}\text{I}$ -leuprorelin. To a tube containing the cell membrane fraction of the CHO with human GnRH receptors expressed were added 2  $\mu\text{l}$  of a solution of 2 mM compound in 60% DMSO and 10  $\mu\text{l}$  of 38 nM  $^{125}\text{I}$ -leuprorelin. To determine maximum binding quantity, a reaction mixture containing 2  $\mu\text{l}$  of 60% DMSO and 10  $\mu\text{l}$  of 38 nM  $^{125}\text{I}$ -leuprorelin was prepared. To determine non-specific binding amount, a reaction mixture containing 2  $\mu\text{l}$  of a solution of 100  $\mu\text{M}$  leuprorelin in 60% DMSO and 10  $\mu\text{l}$  of 38 nM  $^{125}\text{I}$ -leuprorelin was prepared.

Where the membrane fraction of the CHO with monkey and human GnRH receptors expressed was used, the reaction was carried out at  $25^\circ\text{C}$ . for 60 minutes. After each reaction, the reaction mixture was aspirated and filtered through a polyethyleneimine-treated Whatman glass filter (GF-F). After this filtration, the radioactivity of  $^{125}\text{I}$ -leuprorelin remaining on the filter paper was measured with a  $\gamma$ -counter.

The expression  $(\text{TB}-\text{SB})/(\text{TB}-\text{NSB})\times 100$  (where SB=radioactivity with the compound added, TB=maximum bound radioactivity, NSB=nonspecifically bound radioactivity) was calculated to find the binding inhibition rate of each test compound. Furthermore, the inhibition rate was determined by varying the concentration of the test substance and the 50% inhibitory concentration ( $\text{IC}_{50}$  value) of the compound was calculated from Hill plot. The results are shown in below.
